

## Winter 2020-21 Weather Prediction

**The Farmer's Almanac** projection for the coming winter is "above average snowfall and normal to below normal temperatures." The heaviest snowfall for southeast Wisconsin is predicted to be in late December and late January. Heavy snow loads, and more importantly ice, can cause damage on roofs.

### GOOD NEWS!

You have time to assure your flat roof is ready by taking these steps:

- 1 **Check for Leaks**  
Walk the entire surface to visually inspect while particularly searching for sagging, puddled water, cracks and places the roof isn't secure to walls or protrusions.
- 2 **Remove Debris**  
Leaves are still falling and need to be cleared once trees are bare. Take time to remove branches, leaves, and other debris both from the roof surface and drains.
- 3 **Watch for Mold**  
Clean and remove mold, mildew, and algae which can conceal underlying roof issues.
- 4 **Ice Dams and Snow Removal**  
As we get into winter, watch for icicles which may signal ice dams. Ice can be especially damaging to a membrane. Experts note that packed snow in excess of a foot can cause damage to your roof so safely remove it.

### We Complete Roof Work Year Round

While the predictions are for a grueling coming winter, our dedicated team at Precision braves all weather extremes and completes commercial and industrial flat roof projects all year. We also are searching for people who want to work on roofs. So, if you are someone looking for a job, we want to hear from you. Or, if you are considering having us install your roof, we appreciate hearing from you as soon as possible to add your project to our schedule.
