

Roof replacement, or reroofing, is more common than new construction. Count on us to install roofs for both.

When you are faced with replacing a roof that no longer holds up to repairs, a PVC membrane is the best choice.

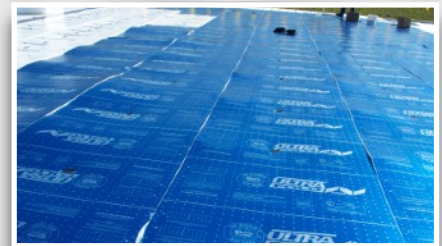

Whether it's a metal, built-up, or rubber reroof select a membrane and you can choose to complete the entire project now or do sections over time.

The most popular reroof is for pre-engineered steel buildings since they have metal roofs.

First we install foam inserts in the fluted portions to bring the roof surface to a consistent level.

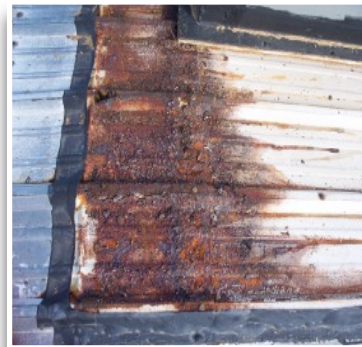

Next a layer of insulation is added. Benefit is two-fold: provides durable surface to apply the membrane to and results in energy savings.

The **PVC membrane is applied** to the insulation and **heat sealed** at any seams.

So you can go from this....

....to this
